

Administrative Security Review for Josh Larsen, MODFLOW-API-AG-Package

Michael Fienen, UMid WSC

No issues of concern were raised in this administrative security review. The following items were evaluated for the administrative software review. My findings are included in *italics* below each item.

1. Personally identifiable information (PII)
None found.
2. Absolute file system paths
All paths are relative, which in addition to better security ensures portability. Clever use was made of internal functions to direct some paths to installed packages without reporting absolute paths.
3. Internal server host names or IP addresses
None found.
4. Usernames/passwords
None found.
